Object: COMMGR v.1.04 is released.

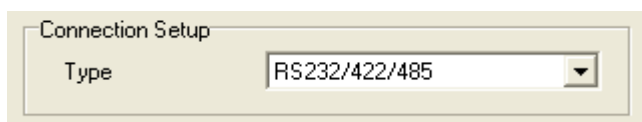

Purpose: The functions which are modified, and the functions which are added are described.

Description:

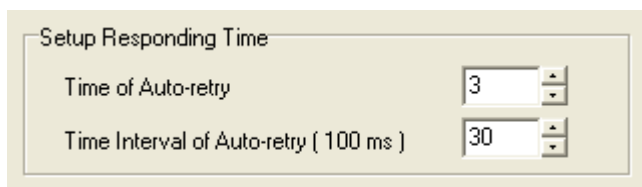

1. The problem that the communication port used may not be released if the automatic detection is triggered is solved.
2. The problem that the device information found last time will not be updated if the Ethernet scan function is used is solved.
3. The problem that no wireless network interface card can be selected in the Windows 7 environment.
4. The stability of USB communication is strengthened.
5. The problem that a driver can not be normally added in the Czech Windows is solved.
6. The problem that an error will occur if COMMGR is closed when communication is carried is solved.
7. The problem that COMMGR does not check whether there are communication ports when it is just started. If no communication ports exist, the status of the driver created should be ERROR.
8. If the checksum of firmware continues incorrect, COMMGR will enable the self-protection mechanism.
9. Users can select a station number in the **Select SN for Auto Detect** window. (If users use an old version of COMMGR, they can only use 0 to enable the automatic detection function.)

10. The RS232 driver in the Type drop-down list box is changed to the RS232/422/485 driver.

11. The unit for measuring a timeout is 100 milliseconds. (Originally, the unit was 1 second.)

12. The version of the DVP simulator is updated.
